

**SchoolBooks – S14**

# **SchoolBooks WEB Demo**

# A couple notes before the demo

# Design Goals

- Run in a browser.
- Run as fast or faster than our desktop product.
- Have the look and feel of a desktop application.
- Appear fresh & look good with Vista or XP.
- Zero learning curve for users of our desktop product.

# Interesting Features

- Does not require any cookies at all. Full context sensitive and searchable help.
- It is very secure. It is difficult to tell how the program works. (So it's difficult to hack.)
- How many browser applications have you seen that allow multiple floating windows? Or really a windowed look at all?

# Interesting Features cont'd

- Software is very compartmentalized and modular. Makes it easy for us to maintain it and fix bugs.
- Acts exactly like an application in screen handling:
  - Key fields enter in upper case, not lower case that switches to upper when you tab out.
  - Dollar figures, account numbers, and phone numbers are formatted on the fly.

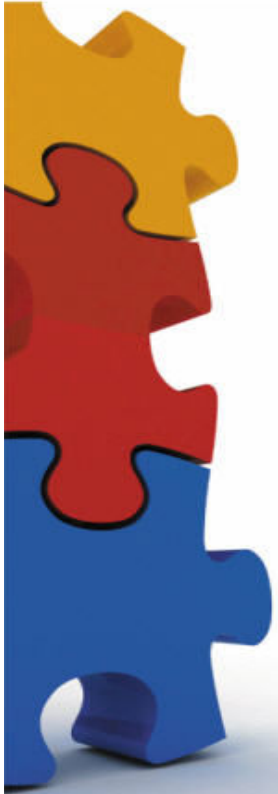

# More Interesting Features

- Speed is extremely fast. One reason is the general use of JSON (JavaScript Object Notation) to compress and transfer screen data instead of pure XML, which is very bloated.

# Let's Walk Through It Or Questions & Answers
